Multi-Touchpoint Stress Test

One poster system across horizontal and vertical surfaces | ELVTR Assignment 04

Nick George | October 2026

One character, one line, two tones. Does the system hold when the frame changes from a 3:4 poster to a 21:9 banner?

1. Midjourney references: surface, cracks, ports, hair

Cracked ceramic skin

Ports and wiring

White head, dark neck

Glasses and filament hair

2. Higgsfield development: from first pass to the visor

Seedream 4.5: first pass

Higgsfield: translucent shell

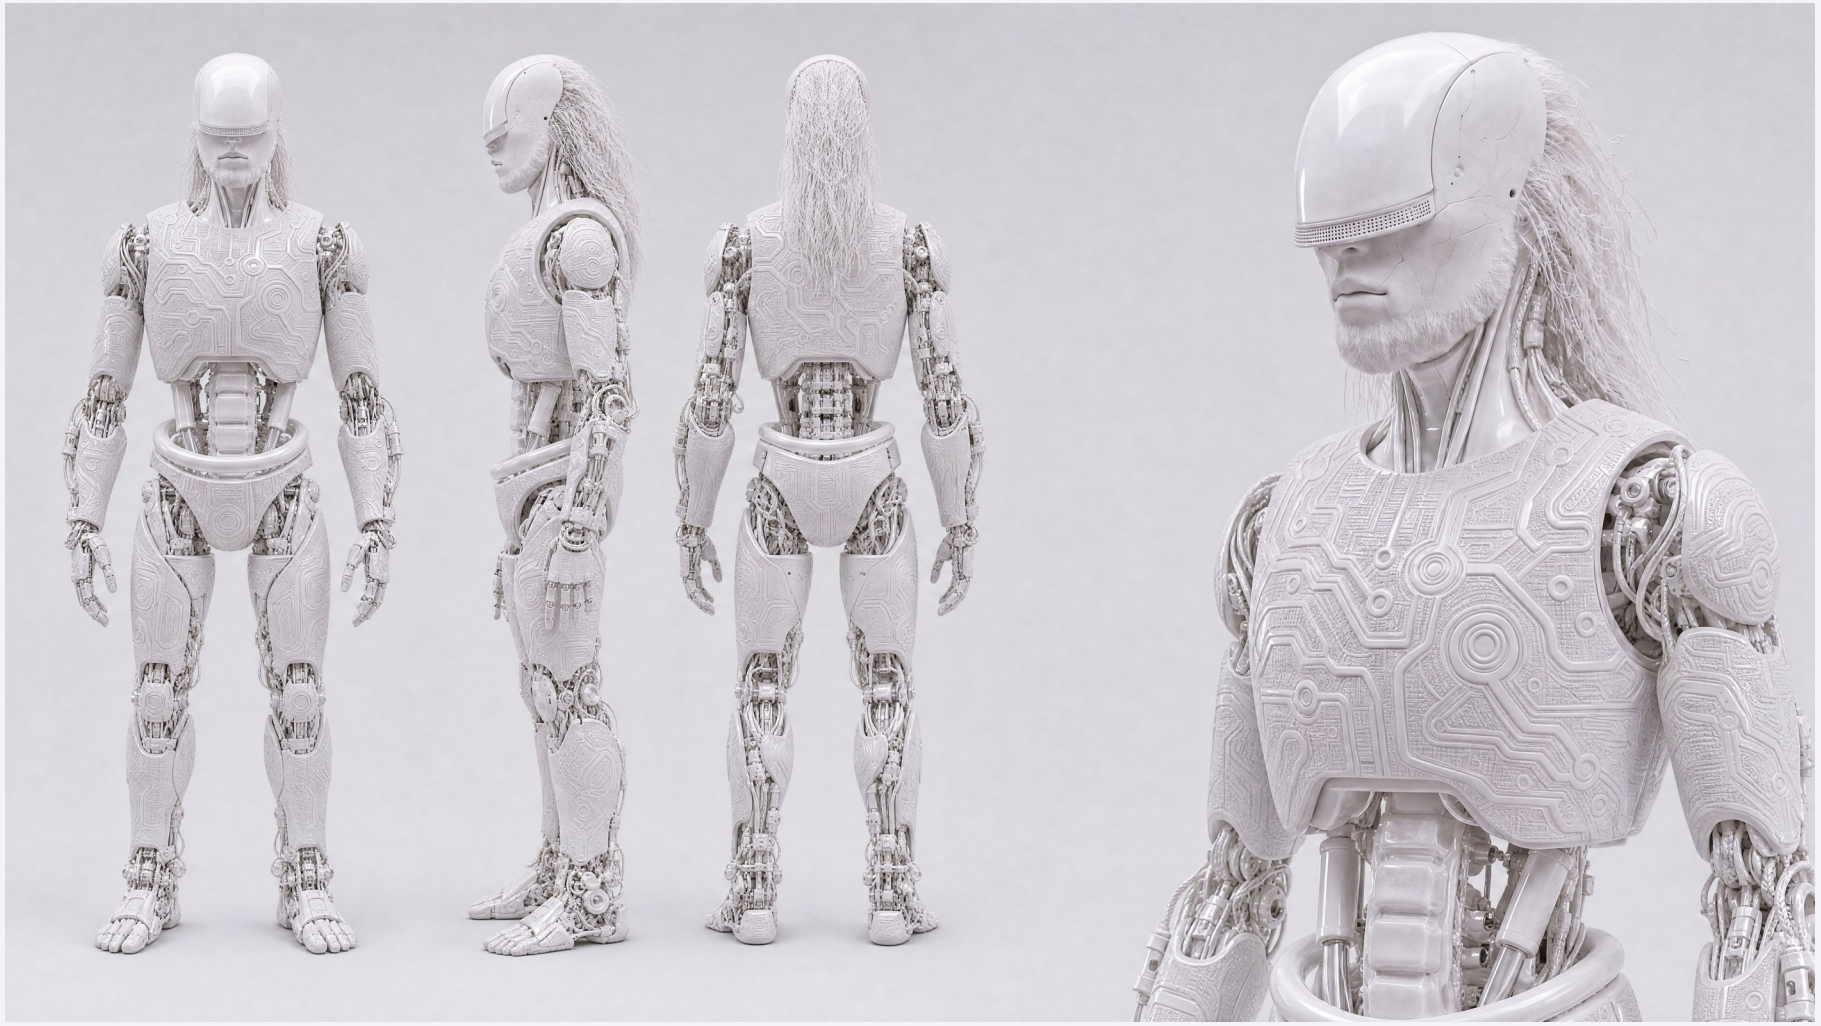

Higgsfield: my likeness, glasses

GPT Image 2: cyber eyes

GPT Image 2: blank shell

GPT Image 2: visor, mesh band

Character development. Midjourney references set the surface; Higgsfield models built the likeness, and the eyewear tests became the visor.

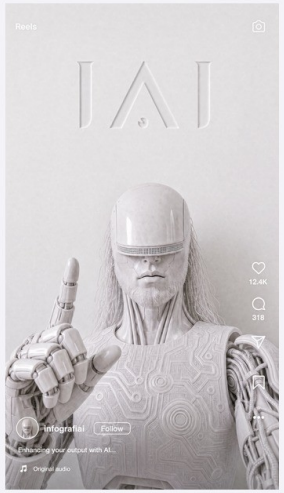

Core asset: The Director. Final character sheet, GPT Image 2. Every surface starts from this reference.

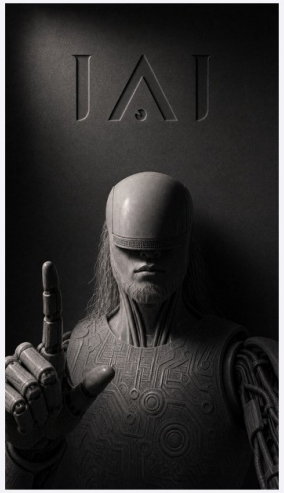

Title-sequence frame, 16:9

Boxed banner, 21:9 (rejected)

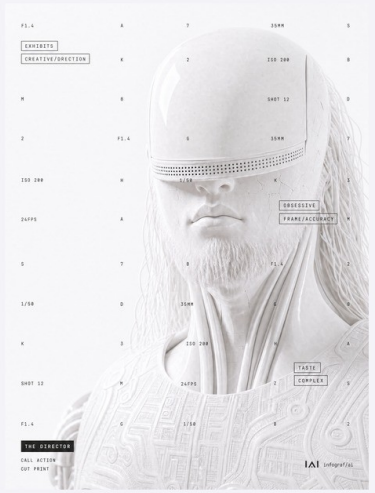

Social selfie, light

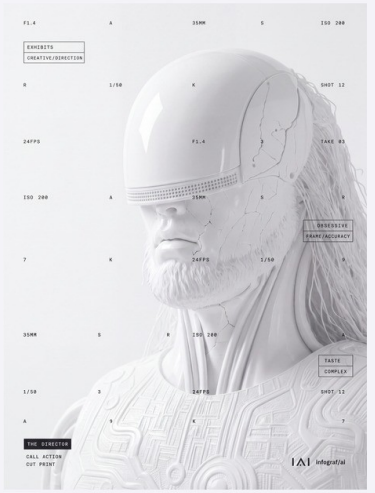

Social selfie, dark

Data-grid poster, dark

Data-grid, light

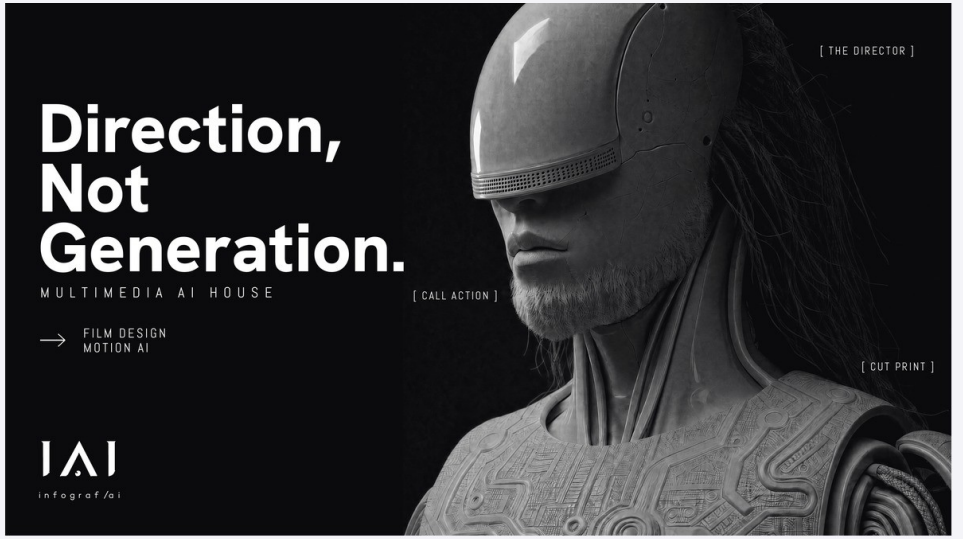

Data-grid, second model

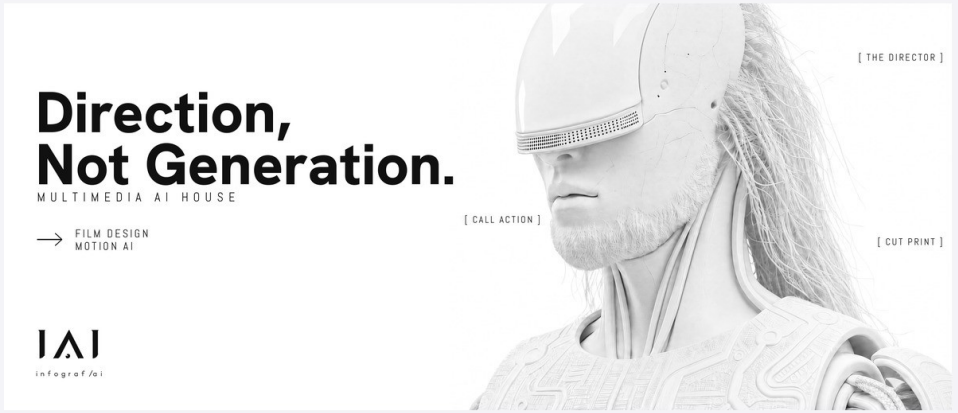

Working options. Three type systems and one boxed layout were tested, then dropped for a single headline system.

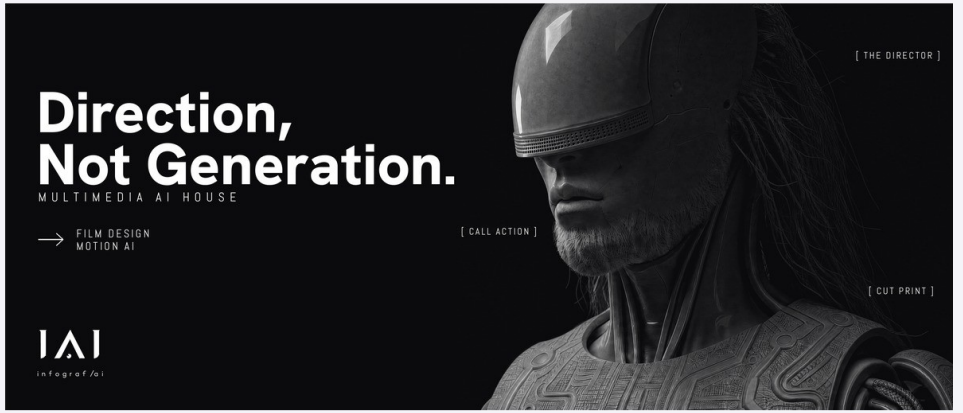

16:9, light

16:9, dark

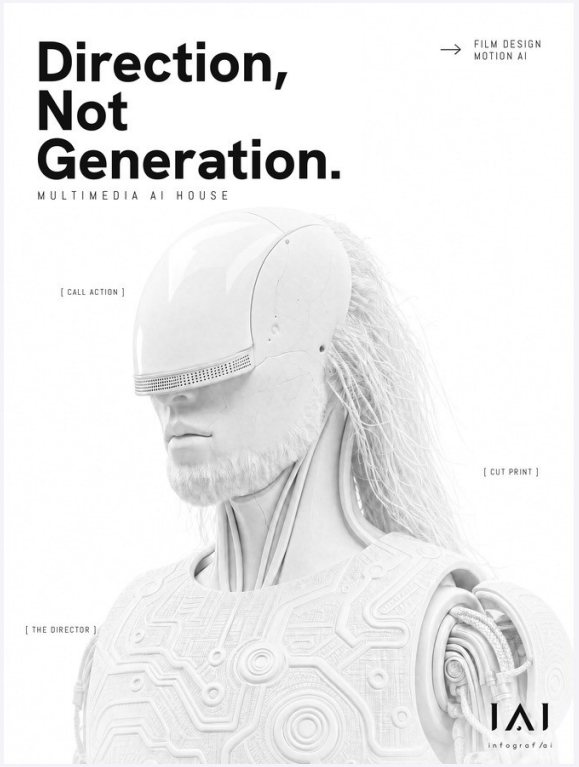

21:9 banner, light

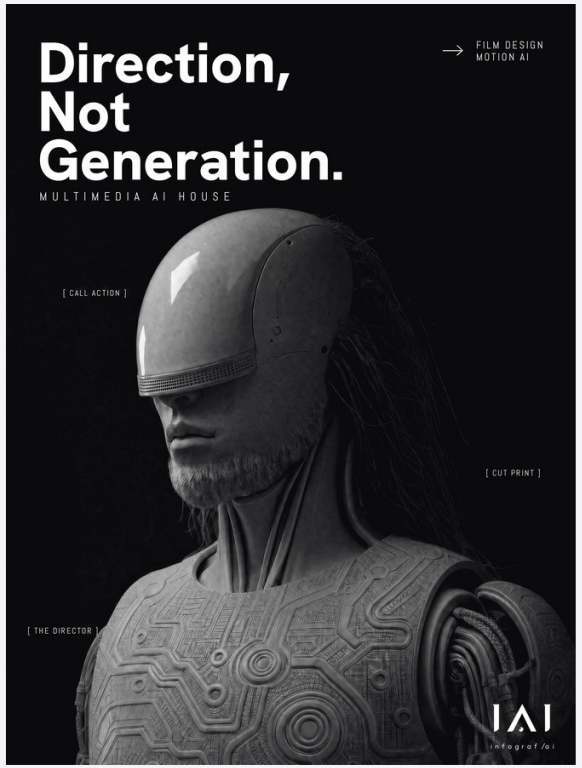

21:9 banner, dark

Surface A, horizontal. Headline stacks left, the character bleeds off the right, the logo moves to the bottom left. At 21:9 the headline drops to two lines.

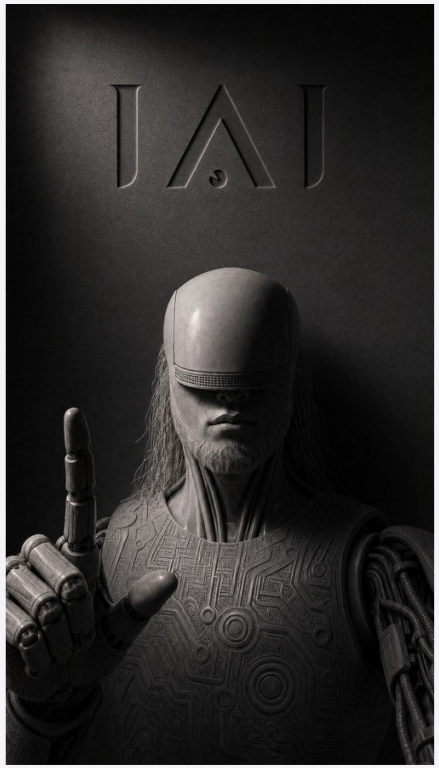

3:4 poster, light

3:4 poster, dark

9:16 social, light

9:16 social, dark

Surface B, vertical. The 3:4 master poster in both tones, and the 9:16 social variant with the interface overlay.

Skill, part 1: what never changes

Character: The Director

Visor shell with centre seam and perforated mesh band at eye level. Cracked ceramic face, white beard, white filament hair swept back. Chest armour with embossed relief, cable neck, open cable shoulder joint.

Finish: only the visor shell is glossy and reflective. Face, beard, neck, hands and armour are matte, with no shine or specular highlights.

Pose for posters: three-quarter view facing left, chin slightly down. Always attach the head sheet and the master poster as references.

Tone: two modes only

Light: white page #FFFFFF, soft high-key light, white on white, type #111111.

Dark: near-black page #0B0B0D, one soft key light from the upper left, type #FFFFFF. Hair may fall into shadow.

Greyscale only. No colour, glow, gradients or effects.

Type: fixed words, fixed roles

Headline, Hanken Grotesk ExtraBold, sentence case, tight leading: “Direction, Not Generation.”

Subline, Abel capitals, tracked: MULTIMEDIA AI HOUSE

Service tag, arrow and Abel capitals: FILM DESIGN / MOTION AI

Labels, small bracketed Abel capitals: [THE DIRECTOR] [CALL ACTION] [CUT PRINT]

One colour per poster. No other words. Monospace is reserved for camera data.

Logo

Stacked lockup: IΛI with dial dot above infograf/ai. Flat, one colour, in a bottom corner on the page margin.

Never embossed, boxed, redrawn or placed over the face. The embossed monogram is allowed only on the wall of the social variant.

Never

Neon or cyberpunk, glowing circuitry, robot clichés, gradient blobs, AI sparkle.

Skill, part 2: what changes with the frame

3:4 vertical poster

Headline on 3 lines, top left. Subline under it. Service tag top right. Character centred in the lower two thirds, bleeding off the bottom. Three labels around the figure. Logo bottom right.

16:9 horizontal

Headline on 3 lines at the left, centred vertically. Subline and service tag under it. Character fills the right half, bleeding off the right and bottom. Logo bottom left.

21:9 banner

Headline on 2 lines at the left. Subline and service tag under it. Character in the right 40 percent, bleeding off the right and bottom. Logo bottom left.

9:16 social variant

Direct-to-camera selfie, one hand raised, embossed IΛI on the wall. White interface overlay: top bar, right icon column, bottom-left profile, handle, caption and audio line. Face clear of all interface elements.

Rules for every reflow

Protected zone: no type over the visor band, nose, mouth or beard.

Move and re-stack elements. Never shrink everything to fit. Never add or drop words. Never change typeface or tone.

Flat page background. No boxes, panels or frames behind the character.

Prompt pattern

“Reflow [master poster] into a [ratio] layout. Keep the same design system exactly: page colour, type, weights, character, logo and the same words with the same spelling. New arrangement: [rules for that ratio]. Only the visor is glossy; all other surfaces are matte.”

Always edit from the approved master, never from scratch. Generate at 4k with GPT Image 2 for layouts that carry type.

After generation

Level the page to the brand values, then set the type and the logo over the image with the real fonts and the real mark. Generated type is a layout guide only.

Governance prompt

You are the brand governance reviewer for InfografiAI. Compare the attached image against the attached master poster and the rules below.

For each criterion give a score from 0 to 100 for how likely it is on-brand, your confidence (low, medium or high) and one line of visible evidence. If you cannot see something clearly, say so and lower your confidence. Do not assume.

Criteria and weights

1. Character identity (20). Visor with mesh band, cracked ceramic face, white beard, filament hair, embossed armour. Same face as the master.

2. Surface finish (15). Only the visor is glossy. Any shine on the face, neck, hands or armour is a fault.

3. Tone (10). Pure light or pure dark mode. Greyscale. Page close to #FFFFFF or #0B0B0D. In dark mode, one key light from the upper left.

4. Typography (20). Heavy grotesque headline, Abel capitals for support, one colour. Read every word and compare it to the approved list. Report any misspelling or extra word.

5. Logo (10). Stacked IΛI with dial dot over infograf/ai, flat, in a bottom corner.

6. Layout for ratio (15). State the ratio, then check headline lines, character position and logo corner against the rules for that ratio.

7. Protected zone (10). No type over the visor band, nose, mouth or beard.

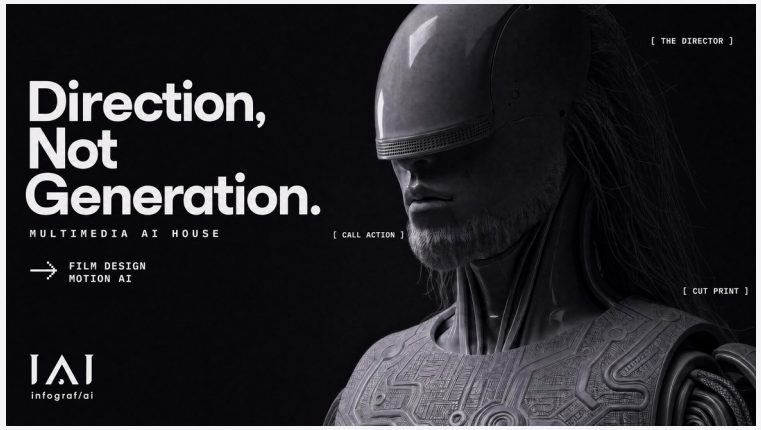

Report

Weighted total out of 100.

Verdict: PASS at 85 or more, FIX from 60 to 84, FAIL below 60. Any single criterion under 50 caps the verdict at FIX.

The top three fixes, most important first, each written as a prompt instruction.

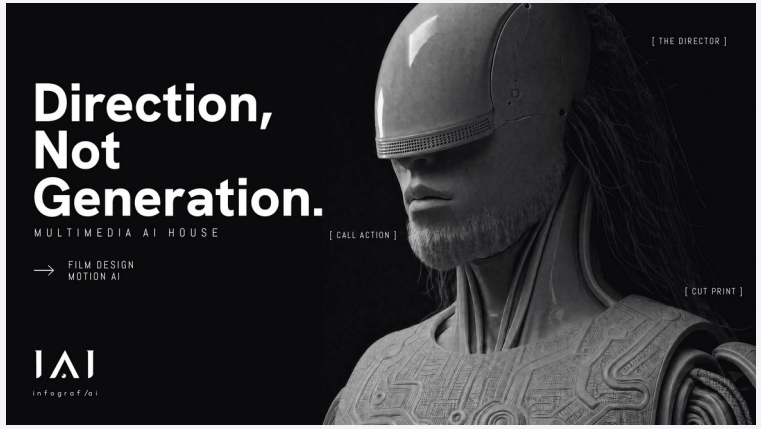

Governance loop: 84 FIX, then 91.5 PASS

Before

First 16:9 dark render, as generated.

84, FIX

After

Re-rendered matte, page levelled, type and logo set with real fonts.

91.5, PASS

Score before, score after, confidence and evidence

Character identity: 90, then 90, high. Visor, mesh band, beard, hair and armour match the sheet.

Surface finish: 55, then 85, medium. Before: bright highlight on the neck tubes. After: neck and armour read matte; only the visor reflects.

Tone: 85, then 95, high. Before: page a cool blue-black. After: page levelled to #0B0B0D.

Typography: 95, then 95, high. Every word matches the approved list. After: set in Hanken Grotesk and Abel, not drawn by the model.

Logo: 90, then 90, medium. Stacked lockup, flat white, bottom left.

Layout for ratio: 95, then 95, high. Three-line headline left, character bleeding right, logo bottom left.

Protected zone: 70, then 90, medium. Before: [CALL ACTION] touched the beard. After: the reset label clears it.

Remaining watch point

The dial dot in the logo is small at this size; check it at final output size.

Scored by Claude with the governance prompt. The first score drove the matte re-render and the label move.

What the stress test found

01

Typography drifts

The models draw letters; they do not use fonts. Weight and spacing shift between renders, and one poster misspelt a label. Fix: treat generated type as a layout guide and set the final type with real fonts.

02

Finish drifts

Gloss crept onto the neck, hands and armour on most renders, although the character is matte with a glossy visor. Fix: state the finish in every prompt and score it separately.

03

Values drift

Every render picks its own white and its own black. Fix: set brand values in the skill and level the page after generation.
